**Part –I**

Welcome back to the lectures in Chemistry and on the topic of Atomic Structure and Chemical Bonding.

(Refer Slide Time: 00:18)

My name is Mangala Sunder; I am from the department of Chemistry, Indian Institute of Technology, Madras. Let us continue to give you a lecture with the tutorial on some of the problems in Angular Momentum and Variational Method; the lectures that were part of the last couple of weeks.

(Refer Slide Time: 00:48)

Chemistry: Atomic Structure and Chemical Bonding  
Video Tutorial on Angular Momentum and  
Variational Method

Data:

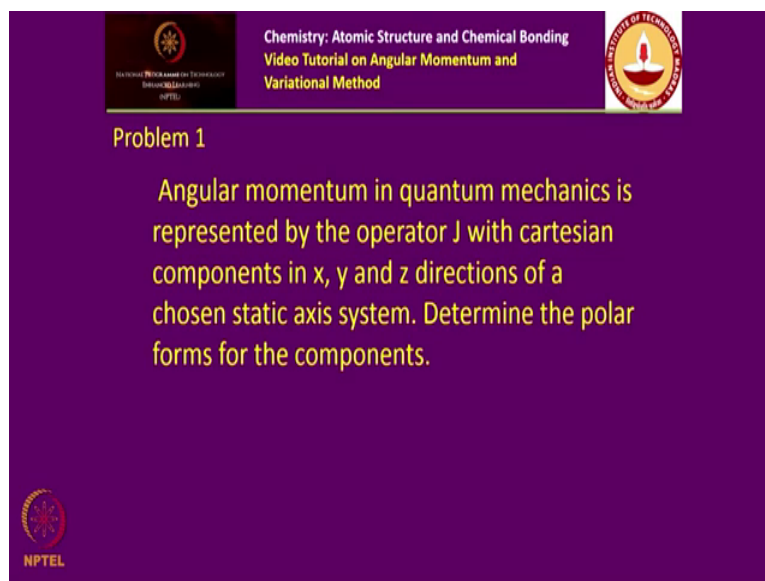

- Planck's constant  $h = 6.626 \times 10^{-34}$  J.s
- Speed of light in vacuum  $c = 2.9979 \times 10^8$  m.s<sup>-1</sup>.
- One atomic mass unit (amu)  $= 1.66 \times 10^{-27}$  kg.

Now, there are 6 or 7 problems from the slide that I have; I have not included spin here, but a lot of questions about spin a half have come in the assign the tutorials that you have online. But we will concentrate on the Angular Momentum Operator; its matrix representation and also some elementary examples on variational principles ok.

The problems are given in the sequence. I shall upload these problem sets before I upload the tutorial, so that those of you who would like to solve these problems on your own without having to look into the answers, we will have some time to check where to do the calculations and then, check the answers with the tutorials here. If you find any mistakes in what I have written down, please feel free to write to me. And you can see that my email co-ordinates are given here; mangal at iitm dot ac dot in and mangala sunder k at gmail dot com.

Variational Method

Problem 1

Angular momentum in quantum mechanics is represented by the operator  $J$  with cartesian components in  $x$ ,  $y$  and  $z$  directions of a chosen static axis system. Determine the polar forms for the components.

Now, let us go to problem 1. This is a problem of representing angular momentum by Cartesian components is asking you to do the following. Angular momentum in quantum mechanics is represented by the operator  $J$  with Cartesian components  $x$ ,  $y$  and  $z$  directions of a chosen static access system. Determine the polar forms for the components.

I am sure you have seen these things again over and again in the last several lectures; but still it is worth doing one exercise on your own particularly calculating the  $J_x$  operator in the polar coordinate system  $r$   $\theta$  and  $\phi$ .

(Refer Slide Time: 02:55)

The slide contains the following handwritten content:

Problem 1

$$\vec{J} = J_x \hat{x} + J_y \hat{y} + J_z \hat{z}$$

$\uparrow$              $\uparrow$              $\uparrow$

$x = r \sin\theta \cos\phi \quad y = r \sin\theta \sin\phi \quad z = r \cos\theta$

$$\vec{J} = \vec{r} \times \vec{p}$$

$$J_x = -i\hbar \left( y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y} \right) \quad J_z = -i\hbar \left( x \frac{\partial}{\partial y} - y \frac{\partial}{\partial x} \right)$$

$$J_y = -i\hbar \left( z \frac{\partial}{\partial x} - x \frac{\partial}{\partial z} \right) \quad \text{Cartesian}$$

Let us go to the solutions.  $J$  represented as a vector in the Cartesian coordinate system;  $J_x$  and  $J_z$ . Now, you represent this using spherical polar coordinates which require the transformation to be used, the following transformations  $x = r \sin\theta \cos\phi$ ,  $y = r \sin\theta \sin\phi$  and  $z = r \cos\theta$ . You are asked to calculate  $J$  which classically is written as  $\vec{r} \times \vec{p}$  and in quantum mechanics using the  $x, y, z$  coordinate system,  $J_x$  is written as  $-i\hbar (y \partial_z - z \partial_y)$ .

The  $-i\hbar (y \partial_z - z \partial_y)$  is the  $x$  component of the momentum linear momentum  $\vec{p}$ . Likewise  $J_y$  is  $-i\hbar (z \partial_x - x \partial_z)$  and  $J_z$  the operator is  $-i\hbar (x \partial_y - y \partial_x)$  ok. So, these are Cartesian representations and you need to write the derivatives also in the polar representation and by now you know the formulae for doing that.

(Refer Slide Time: 04:54)

The image shows a whiteboard with handwritten mathematical derivations. At the top, the chain rule is written as:

$$\frac{\partial}{\partial x} = \frac{\partial r}{\partial x} \frac{\partial}{\partial r} + \frac{\partial \theta}{\partial x} \frac{\partial}{\partial \theta} + \frac{\partial \phi}{\partial x} \frac{\partial}{\partial \phi}$$

Arrows point from the partial derivatives of r, theta, and phi to their respective terms in the chain rule. Below this, the individual partial derivatives are given:

$$\frac{\partial r}{\partial x} = \sin \theta \cos \phi, \quad \frac{\partial \theta}{\partial x} = \frac{\cos \theta \cos \phi}{r}, \quad \frac{\partial \phi}{\partial x} = -\frac{\sin \phi}{r \sin \theta}$$

Then, the chain rule is applied to find the partial derivatives of a function with respect to x, y, and z:

$$\begin{aligned} \rightarrow \frac{\partial}{\partial x} &= \sin \theta \cos \phi \frac{\partial}{\partial r} + \frac{\cos \theta \cos \phi}{r} \frac{\partial}{\partial \theta} - \frac{\sin \phi}{r \sin \theta} \frac{\partial}{\partial \phi} \\ \frac{\partial}{\partial y} &= \sin \theta \sin \phi \frac{\partial}{\partial r} + \frac{\cos \theta \sin \phi}{r} \frac{\partial}{\partial \theta} + \frac{\cos \phi}{r \sin \theta} \frac{\partial}{\partial \phi} \\ \frac{\partial}{\partial z} &= \cos \theta \frac{\partial}{\partial r} - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta} \end{aligned}$$

For example, the derivative  $\frac{\partial}{\partial x}$  is  $\frac{\partial r}{\partial x} \frac{\partial}{\partial r} + \frac{\partial \theta}{\partial x} \frac{\partial}{\partial \theta} + \frac{\partial \phi}{\partial x} \frac{\partial}{\partial \phi}$ . These things have been calculated in the hydrogen atom earlier and therefore, I would simply copy the answers from the notes that was circulated as part of the course.

The derivatives are  $\frac{\partial r}{\partial x}$  is simply  $\sin \theta \cos \phi$  and  $\frac{\partial \theta}{\partial x}$  is  $\frac{\cos \theta \cos \phi}{r}$  and  $\frac{\partial \phi}{\partial x}$  is  $-\frac{\sin \phi}{r \sin \theta}$  ok. They are obtained from the inverse transformation of this ok, when you write  $r$  in terms of  $x^2 + y^2 + z^2$  under the square root and  $\sin \theta$  likewise  $\theta$  and  $\phi$ .

Once you have them, you can calculate the derivatives as you have here. Therefore,  $\frac{\partial}{\partial x}$  is  $\sin \theta \cos \phi \frac{\partial}{\partial r} + \frac{\cos \theta \cos \phi}{r} \frac{\partial}{\partial \theta} - \frac{\sin \phi}{r \sin \theta} \frac{\partial}{\partial \phi}$ . This is the derivative  $\frac{\partial}{\partial x}$ , likewise you need to know the derivative  $\frac{\partial}{\partial y}$  and derivative  $\frac{\partial}{\partial z}$ . In order to calculate the x component of the angular momentum given by this formula  $y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y}$  and so on the others.

Therefore, the first thing is to write to these derivatives and let me just copy the other derivatives from your lecture sets earlier.  $\frac{\partial}{\partial y}$  is given by  $\sin \theta \sin \phi \frac{\partial}{\partial r} + \frac{\cos \theta \sin \phi}{r} \frac{\partial}{\partial \theta} + \frac{\cos \phi}{r \sin \theta} \frac{\partial}{\partial \phi}$

do phi and the last one, do by do z is cos theta do by do r minus sin theta by r do by do theta ok.

(Refer Slide Time: 08:55)

The image shows a handwritten derivation of the Jx operator in spherical coordinates. The derivation starts with the expression:

$$J_x = -i\hbar \left( r \sin\theta \sin\phi \frac{\partial}{\partial z} - r \cos\theta \frac{\partial}{\partial y} \right)$$

It then expands this into a more complex form using the chain rule for the partial derivatives with respect to z and y. The expansion is shown as:

$$J_x = (-i\hbar) \left\{ r \sin\theta \sin\phi \left( \cos\theta \frac{\partial}{\partial r} - \frac{\sin\theta}{r} \frac{\partial}{\partial \theta} \right) - r \cos\theta \left( \sin\theta \sin\phi \frac{\partial}{\partial r} + \frac{\cos\theta \sin\phi}{r} \frac{\partial}{\partial \theta} + \frac{\cos\phi}{r \sin\theta} \frac{\partial}{\partial \phi} \right) \right\}$$

Finally, it simplifies the expression to:

$$\left( -\sin\phi \frac{\partial}{\partial \theta} - \cot\theta \cos\phi \frac{\partial}{\partial \phi} \right) (-i\hbar)$$

So, these 3 need to be substituted into the expression for the corresponding angular momentum operators, namely J x if you have to write that it is given by y which is r sin theta sin phi times do by do z minus z which is r cos theta do by do y. So, let me just do the J x and in a similar way, you can do the other things.

So, if you have to write this its minus i h bar, the derivative that you have to worry about is the derivative do by do z which is given as cos theta do by do r minus sin theta by r do by do theta. And, the other expression is the z which is minus r cos theta sin theta sin phi do by do r plus cos theta sin phi by r do by do theta plus cos phi by r sin theta do by do phi.

You can see that the first term cancels with this one, r sin theta sin phi cos theta r sin theta sin phi cos theta. Therefore, these 2 terms disappear and this term is sin square theta r sin phi and the r goes away. So, this is minus sin square theta do by do theta times sin phi and this term is cos square theta minus sin phi do by do theta. Therefore, these 2 will give you minus sin phi do by do theta.

And the last term that you have is of course, there is no other term is the only one. So, this is given as minus sin theta by r minus sin phi, you have seen that. There is a minus

sin here. So, you get minus cos theta by sin theta is cot cotangent theta and the r goes away and you have cos phi dou by dou phi times minus i h bar.

So, the algebra is very clear that the first thing you need to know is to get these derivatives. The second is a simple substitution of these derivatives in this expression for the x component and the y component and the z component and then, the canceling of the terms and simplifying them and that is all.

(Refer Slide Time: 12:14)

$$J_y = \left( \cos \phi \frac{\partial}{\partial \theta} - \cot \theta \sin \phi \frac{\partial}{\partial \phi} \right) (-i \hbar)$$

$$J_z = -i \hbar \frac{\partial}{\partial \phi}$$

Cartesian  $\rightarrow$  spherical coordinate  
xyz  $\quad$   $r \theta \phi$

So, therefore, the algebra is simple enough for me to write down the corresponding J y components and J z component for you to verify that the J y turns out to be cos phi dou by dou theta minus cot theta sin phi dou by dou phi multiplied by minus i h bar.

And J z turns out to be even simpler and you have already seen the J z in the particle on a ring as well as in the hydrogen atom and that turns out to be simply minus i h bar dou by dou phi or phi ok. So, this is how you do the 3 components of angular momentum in spherical polar coordinates using Cartesian to spherical coordinate transformation variables x y z to r theta phi.

Chemistry: Atomic Structure and Chemical Bonding  
Video Tutorial on Angular Momentum and  
Variational Method

**Problem 2**

Show that the polar forms of  $J_x$ ,  $J_y$  and  $J_z$   
satisfy the commutation relations

$$\begin{aligned} [J_x, J_y] &= i\hbar J_z \\ [J_y, J_z] &= i\hbar J_x \\ [J_z, J_x] &= i\hbar J_y \end{aligned}$$

So, that is the first problem, the second one is to show that the corresponding polar forms of the angular momentum operation  $J_x$ ,  $J_y$  and  $J_z$  satisfy the commutation relations in exactly the same way that they do in Cartesian coordinates.

I mean it is not a surprise it is just algebraic exercise for you. But you know how these commutation relations between  $J_x$  and  $J_y$  and  $J_y$  and  $J_z$  were obtained in the first place.

(Refer Slide Time: 14:00)

Problem 2)

a)

$$[J_x, J_y]f(x,y,z)$$
$$(-i\hbar)^2 \left[ \left( y \frac{\partial}{\partial z} - z \frac{\partial}{\partial y} \right) \left( z \frac{\partial f}{\partial x} - x \frac{\partial f}{\partial z} \right) - \left( z \frac{\partial}{\partial x} - x \frac{\partial}{\partial z} \right) \left( y \frac{\partial f}{\partial z} - z \frac{\partial f}{\partial y} \right) \right]$$
$$\frac{\partial}{\partial z} \left[ z \frac{\partial f}{\partial x} \right] \Rightarrow \frac{\partial f}{\partial x} + z \frac{\partial^2 f}{\partial z \partial x} \quad \frac{\partial^2 f}{\partial x \partial z} = \frac{\partial^2 f}{\partial z \partial x}$$

So, if you recall that the problem 2, part a, if you have to write  $J_x J_y$  then the commutator is you usually work with a function and then later; I mean at least until you become very familiar with these operations, I would write this as operating on a function of  $x y z$  and you know that  $J_x J_y$  both contain a minus  $i \hbar$ . Therefore, I would write this as  $y \frac{\partial}{\partial z} \frac{\partial}{\partial x} f - z \frac{\partial}{\partial y} \frac{\partial}{\partial z} f$ .

Acting on this quantity  $z \frac{\partial}{\partial y} \frac{\partial}{\partial z} f - x \frac{\partial}{\partial x} \frac{\partial}{\partial z} f$  that is  $J_x J_y$  and  $J_y J_x$  is  $z \frac{\partial}{\partial y} \frac{\partial}{\partial x} f - x \frac{\partial}{\partial x} \frac{\partial}{\partial z} f$ . Acting on this quantity which is  $y \frac{\partial}{\partial z} \frac{\partial}{\partial x} f - z \frac{\partial}{\partial y} \frac{\partial}{\partial z} f$ . This is what you have to do and you can see that the derivative  $\frac{\partial}{\partial z}$  sorry, the derivative  $\frac{\partial}{\partial z}$  acting on this gives you, it is a product of functions here because  $f$  is a function of  $x y z$ .

Therefore, this derivative will also contain  $x y z$  and that is also  $f z$ . So, the only thing that you have to be careful about is in writing this term that  $\frac{\partial}{\partial z}$  acting on  $z \frac{\partial}{\partial x} f$  is to give you  $\frac{\partial}{\partial x} f$  because, that is left over then the derivative  $x$  on  $z$  or  $x$  derivative of  $z$ . And, the other term is that  $z \frac{\partial}{\partial z} \frac{\partial}{\partial x} f$  and you must know that  $\frac{\partial}{\partial z} \frac{\partial}{\partial x} f$  is for a well behaved function  $\frac{\partial}{\partial z} \frac{\partial}{\partial x} f = \frac{\partial}{\partial x} \frac{\partial}{\partial z} f$ . The order of differentiation is irrelevant and we would consider only those functions.

(Refer Slide Time: 16:43)

$$\begin{aligned}
 & \underline{[J_x, J_y]} = i\hbar J_z \\
 & \therefore (J_x J_y - J_y J_x) f(r, \theta, \phi) \\
 & = \left[ \left( -\sin\phi \frac{\partial}{\partial \theta} - \cot\theta \cos\phi \frac{\partial}{\partial \phi} \right) \left( \cos\phi \frac{\partial}{\partial \theta} - \cot\theta \sin\phi \frac{\partial}{\partial \phi} \right) \right. \\
 & \quad \left. - \left( \cos\phi \frac{\partial}{\partial \theta} - \cot\theta \sin\phi \frac{\partial}{\partial \phi} \right) \left( -\sin\phi \frac{\partial}{\partial \theta} - \cot\theta \cos\phi \frac{\partial}{\partial \phi} \right) \right] (-i\hbar)^2 \\
 & \Rightarrow i\hbar \left( -i\hbar \frac{\partial}{\partial \phi} \right) J_z
 \end{aligned}$$

This is how one obtains  $J_x J_y - J_y J_x = i\hbar J_z$ . Now we are supposed to verify this using the polar form. Therefore, I do not think there should be any problem.

But let me write one step and leave the rest of it for you have to do the same way. So,  $J_y$  let us first do the term  $J_x J_y$  minus  $J_y J_x$  on a function of  $r$ ,  $\theta$  and  $\phi$ .

And then, we will neglect have been removes the function at the end of the calculations. What you see here is  $-\sin \phi \frac{d}{d\theta} - \cot \theta \cos \phi \frac{d}{d\phi}$ . All of this is  $J_x$  and  $J_y$  is  $\cos \phi \frac{d}{d\theta} - \cot \theta \sin \phi \frac{d}{d\phi}$ . This is  $J_x J_y$  on  $f$  minus  $J_y J_x$  on  $f$  is obviously,  $\cos \phi \frac{d}{d\theta} - \cot \theta \sin \phi \frac{d}{d\phi}$ ; acting on the function obtained through the differentiation  $\frac{d}{d\theta} - \cot \theta \cos \phi \frac{d}{d\phi}$ . This is all that you have to calculate; of course, the whole thing is multiplied by  $-\hbar^2$ .

So, if you go through the algebra, keeping in mind that  $\frac{d}{d\theta}$  acting on this term; obviously, gives you only  $\frac{d^2}{d\theta^2} f$  because,  $\cos \phi$  is not affected by it. But  $\frac{d}{d\theta}$  acting on  $\cot \theta$  and  $\frac{d}{d\phi}$  will give 2 terms and likewise,  $\frac{d}{d\phi}$  on each one of these will give you 2 terms; one being the action on  $\cos \phi$ , the other being the action on  $\frac{d}{d\theta}$  which is a function of  $\phi$ .

And likewise here, the action on  $\sin \phi$  and the action on  $\frac{d}{d\phi}$ . You have to do in a similar way and this will give you the result actually  $\hbar^2 \Delta$ . Let us say  $\hbar^2 \Delta$  and you know what is  $\Delta$ .  $\Delta$  will be  $-\hbar^2 \frac{d}{d\phi}$ . This is what you should get.

This is  $\hbar^2 \Delta$  because  $J_x J_y$  gives you that  $\Delta$ . It is a fair enough, it is a somewhat lengthy, but a lengthy calculation, but when you are doing it for the first time, it is what sitting down and doing this algebra for yourself and convince that you do not leave any holes behind your approach and your learning process. So, this is a fairly straightforward problem for you.

(Refer Slide Time: 20:22)

Chemistry: Atomic Structure and Chemical Bonding  
Video Tutorial on Angular Momentum and  
Variational Method

**Problem 3**

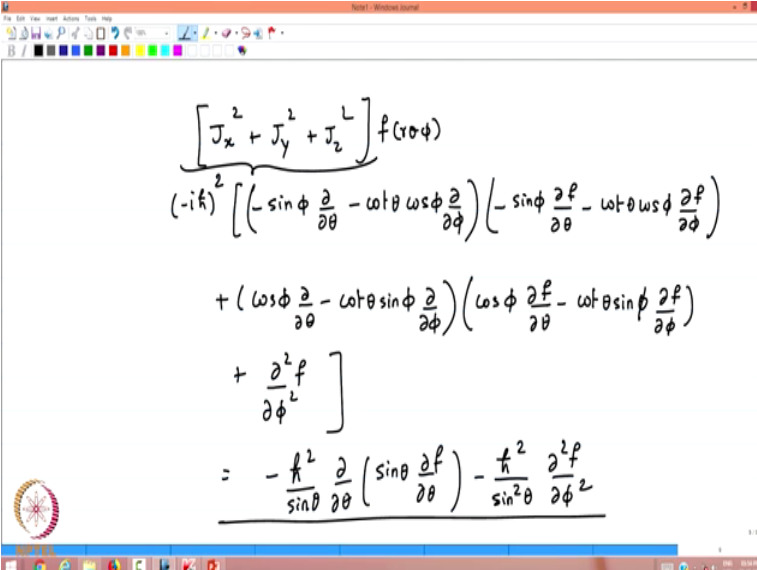

Show that the square of the angular momentum operator in the polar form is given by the expression

$$-\hbar^2 \left\{ \frac{1}{\sin\theta} \frac{\partial}{\partial\theta} \left( \sin\theta \frac{\partial}{\partial\theta} \right) + \frac{1}{\sin^2\theta} \frac{\partial^2}{\partial\phi^2} \right\}$$

Let us go to the next problem. The next problem is to show that the square of the angular momentum operator in the polar form is given by the expression minus h bar square 1 by sin theta dou by dou theta sin theta dou by dou theta plus 1 by sin square theta dou square by dou phi square. All that you have to do is obviously; repeat the calculation that you have done from the angular momentum operator by using this operator; J x square plus J y square plus J z square.

(Refer Slide Time: 21:03)

The image shows a handwritten derivation in a software application window. The derivation starts with the expression for the squared angular momentum operator acting on a function f(theta, phi):

$$\left[ J_x^2 + J_y^2 + J_z^2 \right] f(\theta, \phi)$$

The next step shows the expansion of this operator using the components of angular momentum in polar coordinates:

$$(-\hbar^2)^2 \left[ \left( -\sin\phi \frac{\partial}{\partial\theta} - \cot\theta \cos\phi \frac{\partial}{\partial\phi} \right) \left( -\sin\phi \frac{\partial f}{\partial\theta} - \cot\theta \cos\phi \frac{\partial f}{\partial\phi} \right) \right. \\ \left. + \left( \cos\phi \frac{\partial}{\partial\theta} - \cot\theta \sin\phi \frac{\partial}{\partial\phi} \right) \left( \cos\phi \frac{\partial f}{\partial\theta} - \cot\theta \sin\phi \frac{\partial f}{\partial\phi} \right) \right. \\ \left. + \frac{\partial^2 f}{\partial\phi^2} \right]$$

The final result is the simplified form of the operator:

$$= -\frac{\hbar^2}{\sin\theta} \frac{\partial}{\partial\theta} \left( \sin\theta \frac{\partial f}{\partial\theta} \right) - \frac{\hbar^2}{\sin^2\theta} \frac{\partial^2 f}{\partial\phi^2}$$

So, the  $J_x^2$  term is of course, you know if you have to write this it is  $-\hbar^2 \sin^2 \theta \frac{\partial}{\partial \phi}$ ; acting on itself, if you want to write a function here on  $r$ ,  $\theta$  and  $\phi$  is acting on this function  $-\hbar^2 \sin^2 \theta \frac{\partial}{\partial \phi} f$ .

This is  $J_x^2$  and likewise for  $J_y^2$  you will come plus  $\cos^2 \theta \frac{\partial}{\partial \phi}$ , acting on this function  $\cos^2 \theta \frac{\partial}{\partial \phi} f$  and the last one, is of course, you have taken the  $-\hbar^2$  whole square. Therefore, it is simply  $\hbar^2 \frac{\partial}{\partial \phi}$  square of  $f$ .

And then, of course, when you get the simplified expression, you will see that the  $f$  is an arbitrary function. Therefore, the identity is between this operator and the corresponding operator form; which of course, will turn out to be  $-\hbar^2 \frac{1}{\sin^2 \theta} \frac{\partial}{\partial \phi}$  of  $f$ . And we will have  $-\hbar^2 \frac{1}{\sin^2 \theta} \frac{\partial}{\partial \phi}$  square of  $f$ .

I think that is what you have here,  $-\hbar^2 \frac{1}{\sin^2 \theta} \frac{\partial}{\partial \phi}$  and then,  $1/\sin^2 \theta$  with the  $-\hbar^2$ . So, you get that ok. Again it is a simple repeated application of these derivatives to each other and then, simplifying algebraically.

(Refer Slide Time: 24:11)

Chemistry: Atomic Structure and Chemical Bonding  
Video Tutorial on Angular Momentum and Variational Method

**Problem 4**

Determine the matrix representation of angular momentum operators  $J_x$ ,  $J_y$  and  $J_z$  for the quantum numbers  $J = 1$  and  $J = 2$

Now, the next problem is a fairly simple problem. It says determine the matrix representations of angular momentum operators  $J_x$ ,  $J_y$  and  $J_z$  for the quantum numbers  $J$  is equal to 1 and 2 ok. I think all you need to do is to recall the action of the angular momentum operator on the basis set for each  $J$  value. But  $J$ , any  $J$  integral value the basis set will contain  $2J + 1$  basis functions  $J_m$  or  $J_k$  or whatever label that you put in.

If you remove the dimensions out of  $J$ , usually we write it in the form of  $i_x$  and  $i_y$  and  $i_z$ ; does not matter now. What matters is that you are the basis functions which are only  $2J + 1$  in number for  $J$  value and therefore, for  $J$  is equal to 1; there are 3 basis functions and for  $J$  is equal to 2; there are 5 basis functions.

Therefore, the operators for the basis set corresponding to  $J$  equal to 1, they will all be 3 by 3 matrices and the operators for  $J$  is equal to 2 will all be 5 by 5 matrices, that is one thing you need to know. The second is of course, immediate recalling this result, you must know the 3 operational properties,  $J_+$  on  $J_m$  is given by  $\hbar \sqrt{J(J+1) - m(m+1)}$  changing the basis set to  $J_{m+1}$ .

(Refer Slide Time: 25:35)

And therefore, in a similar way  $J_-$  on  $J_m$  is given by  $\hbar \sqrt{J(J+1) - m(m-1)}$  giving you the basis function  $J_{m-1}$  and the last one is the  $J_z$  on  $J_m$  giving you  $\hbar m |J, m\rangle$ . This is an eigen function for the  $J_z$  operator. But it is not an eigen function for the plus or minus operators.

Therefore, the  $J_+$  matrix element, if you have to do this for spin 1, the matrix will be given by these 3 by 3 matrix quantities.  $\langle 1, 1 | J_+ | 1, 1 \rangle$ ,  $\langle 1, 1 | J_+ | 1, 0 \rangle$  and  $\langle 1, 1 | J_+ | 1, -1 \rangle$  and this is the basis function  $|1, 1\rangle$ , the row is along  $|1, 1\rangle$  and the columns all contain different basis functions.

So, next one is  $\langle 1, 0 | J_+ | 1, 1 \rangle$  and  $\langle 1, 0 | J_+ | 1, 0 \rangle$  and  $\langle 1, 0 | J_+ | 1, -1 \rangle$  and likewise  $\langle 1, -1 | J_+ | 1, 1 \rangle$ ,  $\langle 1, -1 | J_+ | 1, 0 \rangle$  and  $\langle 1, -1 | J_+ | 1, -1 \rangle$ . Now, looking at the 3 equations that you have here,  $J_+ |m\rangle = \hbar \sqrt{j(j+1) - m(m+1)} |m+1\rangle$  and therefore, if I do the matrix element calculation that  $\langle m | J_+ | m \rangle$ , I know that the result will be  $\hbar \sqrt{j(j+1) - m(m+1)}$  ok. Therefore, that is orthogonal this is 0.

So, you can see immediately that the 3 diagonal elements are 0 and the second is that  $J_+ |m\rangle = \hbar \sqrt{j(j+1) - m(m+1)} |m+1\rangle$ , the difference between the 2 is only  $m+1$  or  $m-1$ . In the case of  $J_+$  operator, it is always plus 1 from left. If you have  $J_+ |m\rangle$  on the left, the right hand side can only contain  $J_+ |m-1\rangle$  because, if you look at  $J_+ |m-1\rangle$  that will give you the basis function  $|m\rangle$  and some constant.

Let us say a constant given by this formula. Therefore, you can see that the orthogonality of the basis set in angular momentum is such that this is the only non-zero matrix element for  $J_+$ . Therefore, every time you are going to do this for the spectroscopy for the angular momentum calculations in quantum mechanics for space fixed angular momentum operators, you would see  $J_+$  is connecting  $m-1$  state to the  $m$  state. Therefore, this is non-zero  $m-1$  to  $m$  state this is non-zero. This is that the states different by 2 values of  $m$ .

This is  $m-1$  to  $m$  is  $m-1$ . Therefore, this is  $m+2$ . Therefore, this is 0 and this is also 0. Here, we do not even have a problem.  $J_+ |1, 1\rangle$  is anyway 0 because this is the maximum value; you remember when  $m$  is equal to  $J$  this goes to 0. Therefore, this is 0 and likewise,  $J_+$  this we have already looked at and you can see that this is also  $\langle 1, 0 | J_+ | 1, 0 \rangle$  will actually move it to  $|1, 1\rangle$  and therefore, this is also 0 ok. So, you are essentially left with calculating only 2 matrix elements for  $J_+$  in the spin 1 state; this one and this one. What about  $J_-$ ?

(Refer Slide Time: 30:49)

The image shows a handwritten derivation in a presentation window. At the top, it states  $J_- = (J_+)^{\dagger}$ . Below this, it defines  $J_+ = J_x + iJ_y$  and  $J_- = J_x - iJ_y$ , with arrows pointing from the  $J_x$  and  $J_y$  terms in the definitions to the corresponding terms in the matrix equations. The main part of the derivation shows a matrix for  $J_+$  with elements  $\begin{pmatrix} 0 & x & 0 \\ 0 & 0 & x \\ 0 & 0 & 0 \end{pmatrix}$  and an arrow pointing to a matrix for  $J_-$  with elements  $\begin{pmatrix} 0 & 0 & 0 \\ x^* & 0 & 0 \\ 0 & x^* & 0 \end{pmatrix}$ . The window includes a toolbar at the top and a taskbar at the bottom.

No problem, J minus is J plus Hermitian adjoint. Remember J plus operator is J x plus i J y and the operators J x and J y all Hermitian. Therefore, J minus is the Hermitian adjoint of J plus. Therefore, if you have a matrix with 2 non-zero elements here and everything else is 0, then if this is J plus; then, the corresponding matrix for J minus would be the transpose Hermitian conjugate.

Of course, you have to take into account and that will turn out to be 0 x star 0 and 0 0 x star, then you have 0 0 0 ok. Therefore, this is how you calculate the matrix elements of J plus and J minus.

The image shows a whiteboard with the following handwritten equations:

$$\langle 11 | J_+ | 10 \rangle = \frac{\hbar}{\sqrt{2}} \sqrt{1 \times 2} | 11 \rangle$$

$$= \sqrt{2}$$

$$\langle 10 | J_+ | 1-1 \rangle = \langle 10 | \sqrt{2 \times 1} | 10 \rangle = \sqrt{2}$$

$$J_+ = \begin{pmatrix} 0 & \sqrt{2} & 0 \\ 0 & 0 & \sqrt{2} \\ 0 & 0 & 0 \end{pmatrix} \quad J_- = \begin{pmatrix} 0 & 0 & 0 \\ \sqrt{2} & 0 & 0 \\ 0 & \sqrt{2} & 0 \end{pmatrix}$$

So, let us see the 2 elements that we have to calculate.  $11 J_+ 10$  is obviously,  $\hbar J_+ m$  which is  $1$  this is  $J_+ m$   $J_+ m + 1$  which is  $2$  and the state is  $11$ . Now, it is taken as a scalar product with the state  $11$  that would the answer is  $\sqrt{2}$ .

Likewise  $10 J_+$  on  $1-1$  is  $10$  and this action  $J_+ 1 J_+ m$   $J_+ m$  will give you square root  $2$  and  $J_+ m + 1$  is  $1$  and state will be  $10$ . Therefore, these 2 normalize each other to give you again a root  $2$ . Therefore, the matrix form of  $J_+$  is  $0 \sqrt{2} 0$  sorry  $0 0 \sqrt{2} 0 0 0$ . So, what about  $J_-$ ?  $J_-$  is  $0 \sqrt{2} 0 0 0 \sqrt{2} 0 0 0$  because this is the adjoint or transpose complex conjugate of this matrix.

The image shows a whiteboard with handwritten mathematical derivations for the angular momentum operators  $J_x$ ,  $J_y$ , and  $J_z$  in a 3x3 matrix representation. The derivations are as follows:

$$J_x = \frac{1}{2}(J_+ + J_-) = \frac{1}{\sqrt{2}} \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$$

$$J_y = +\frac{1}{2i}(J_+ - J_-) = \frac{-i}{\sqrt{2}} \begin{pmatrix} 0 & 1 & 0 \\ -1 & 0 & 1 \\ 0 & -1 & 0 \end{pmatrix}$$

$$= -\frac{i}{2}(J_+ - J_-)$$

$$\langle J_m | J_z | J_m \rangle = \langle J_m | m J_m \rangle = m \begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & -1 \end{pmatrix}$$

Now, you know the answer for  $J_x$ .  $J_x$  is  $\frac{1}{2}(J_+ + J_-)$  and therefore, if you add these 2 matrices, the result that you will get is  $\frac{1}{\sqrt{2}} \begin{pmatrix} 0 & 1 & 0 \\ 1 & 0 & 1 \\ 0 & 1 & 0 \end{pmatrix}$ . If you have to calculate, it will be  $\frac{-i}{\sqrt{2}} \begin{pmatrix} 0 & 1 & 0 \\ -1 & 0 & 1 \\ 0 & -1 & 0 \end{pmatrix}$  and you see that the  $J_-$  comes with a minus sign. Therefore, if you write this, this is  $\frac{-i}{\sqrt{2}} \begin{pmatrix} 0 & 1 & 0 \\ -1 & 0 & 1 \\ 0 & -1 & 0 \end{pmatrix}$ .

And this you can write it as  $\frac{-i}{\sqrt{2}}$ . Since the operator  $J_-$  comes with a negative sign, you have to be careful. This is the operator for  $J_+$  and the operator for  $J_-$  comes with a minus sign. Therefore, this is the operator for  $J_-$  and the sum of the 2 gives you that with the minus sign by  $\frac{-i}{\sqrt{2}}$ .

This is the  $J_y$  and  $J_z$  on  $|J, m\rangle$  is of course, is diagonal, it gives you  $m$  times  $|J, m\rangle$ . Therefore, the only matrix element that will be non-zero is if you do  $J_z$  on this, if you take the scalar product of this; then, what you have is the scalar product of  $J_z$  on  $|J, m\rangle$  and that is  $m$ .

Therefore, you have  $\begin{pmatrix} 1 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & -1 \end{pmatrix}$  because  $m$  is 1 in this column, 0 in this column and minus 1 sorry 1 in this row, 0 in this row, minus 1 in this row and therefore, this is the  $J_z$  operator. So, in a similar way, we can do the angular momentum  $J$  is equal to 2, but let us have a small break here.

And then, continue with the angular momentum 2 representation of all these operators and also the remaining 2 problems; 2 or 3 problems that we have in this video tutorial ok. We will pause for a short break.

Thank you.
