Example 10 - Integer solutions of an equation

By
Prof. S.R.S Iyengar
Department of Computer Science
IIT Ropar

Find the number of integer solutions to the equation $x_1 + x_2 + x_3 = 7$, well the question doesn't end here there are some conditions given x_1 should lie in the range 0 to 2, x_2 should lie in the range 0 to 4, and x_3 should lie in the range 0 to 3,
(Refer Slide Time: 00:27)

in week 1 we have also seen such questions where rather in counting chapter we have seen questions where we are just asked to find the number of solutions for the equation without any such conditions, but now we have to follow these conditions and find the possibilities which fit this equation.

Now if I consider N to be the set of all possibilities we know that it is going to be $3 + 7 - 1$ choose 7, how? By the concept of sticks and cups you know that N is 3 here, R is 7, so by the

formula it is $N + R - 1$ choose R and hence it is $3 + 7 - 1$ choose 7 which is 9 choose 7 which happens to be 36 ,
 (Refer Slide Time: 01:22)

IIT
Ropar

Find the number of integer solutions to the equation $x_1 + x_2 + x_3 = 7$; $0 \leq x_1 \leq 2$, $0 \leq x_2 \leq 4$, $0 \leq x_3 \leq 3$.

$$N = \binom{3+7-1}{7} = 36$$

$n=3$ $r=7$
 $\binom{n+r-1}{r}$

NPTEL

now this is all possibilities, but don't you think we are over counting because here you would have even those possibilities where X_1 is at least 3, right it is at least 3 here whereas the given condition is it should lie in the range 0 to 2, so we are over counting some possibilities.

Now the next step would be to subtract all those unwanted possibilities, how do we do that? Let us set C_1 to be the condition where it has solutions with X_1 greater than or equal to 3, and C_2 to be those solutions for the equation with X_2 greater than or equal to 5, and C_3 to be the condition where X_3 is greater than or equal to 4, so these are the three conditions,
 (Refer Slide Time: 02:16)

C_1 : Solution where $x_1 \geq 3$

C_2 : Solution where $x_2 \geq 5$

C_3 : Solution where $x_3 \geq 4$

so I am setting the conditions this way, I am going to see what is $N(C_1)$? How do I calculate that? I have to find out all those solutions where X_1 is at least 3,
(Refer Slide Time: 02:32)

$N(C_1) =$

All solutions to $x_1 + x_2 + x_3 = 7$ where
 x_1 is at least 3.

now it is precisely finding out the solution for the equation $X_1 + X_2 + X_3 = 4$, how did I come to know this? This equation it was $X_1 + X_2 + X_3 = 7 - 3$ which is 4, now adding 3 on both sides adding 3 to X_1 or and to the RHS it gives me the original equation,

(Refer Slide Time: 03:02)

$N(G) =$

All solutions to $x_1+x_2+x_3=7$ where x_1 is at least 3.

$$x_1+x_2+x_3=7-3$$

Add 3 on both sides

$$x_1+3+x_2+x_3=7$$

IIT Ropar

NPTEL

did you observe what I am doing take a moment to think and understand what is happening here, in how many ways can we get solution for this equation, it is nothing but $3 + 4 - 1$ choose 4 which happens to be 6 choose 4, which is 15 because it is $6 \times 5 / 2$,

(Refer Slide Time: 03:24)

$N(G) = \binom{3+4-1}{4}$

$$= \binom{6}{4}$$
$$= \frac{6 \times 5}{2}$$
$$= 15$$

All solutions to $x_1+x_2+x_3=7$ where x_1 is at least 3.

$$x_1+x_2+x_3=4$$

Add 3 on both sides

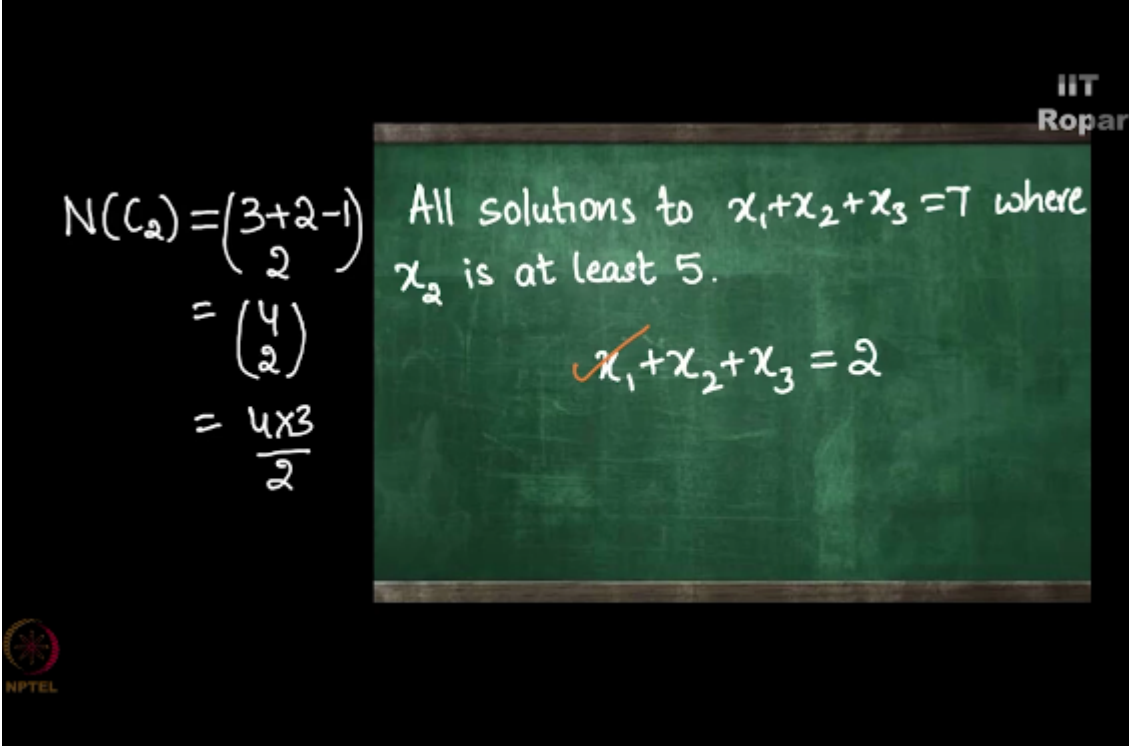

$$x_1+3+x_2+x_3=7$$

IIT Ropar

NPTEL

now moving on to number of elements following C2 condition that is $N(C_2)$ it happens to be the solutions which are having X_2 at least 5, now following on the same lines it is precisely asking the solution to the equation $X_1 + X_2 + X_3 = 2$, where X_2 happens to be at least 5, right.

Now what are the solutions for this equation, it is $3 + 2 - 1$ choose 2 which is 4 choose 2, and 4 choose 2 is $\frac{4 \times 3}{2}$ which is 6,
(Refer Slide Time: 04:03)

The slide features a chalkboard with the following text:

IIT Ropar

All solutions to $x_1 + x_2 + x_3 = 7$ where x_2 is at least 5.

$x_1 + x_2 + x_3 = 2$

On the left side of the slide, the calculation is shown as follows:

$$N(C_2) = \binom{3+2-1}{2}$$
$$= \binom{4}{2}$$
$$= \frac{4 \times 3}{2}$$

In the bottom left corner, there is a logo for NPTEL.

now following the same for C3 the solutions where X_3 is at least 4 we have to find out $N(C_3)$, now it is the same thing as asking the solutions to the equation $X_1 + X_2 + X_3 = 3$,
(Refer Slide Time: 04:21)

$$N(C_3) =$$

IIT
Ropar

All solutions to $x_1 + x_2 + x_3 = 7$ where
 x_3 is at least 4.

$$x_1 + x_2 + x_3 = 3$$

NPTEL

how many solutions do we have which satisfy this equation, it is $3 + 3 - 1$ choose 3 which is 5 choose 2, 5 choose 2 happens to be $\frac{5 \times 4}{2}$ which is nothing but 10, now that we have calculated $N(C_1)$ $N(C_2)$ and $N(C_3)$
(Refer Slide Time: 04:36)

$$N(C_3) = \binom{3+3-1}{3}$$

$$= \binom{5}{2}$$

$$= \frac{5 \times 4}{2}$$

$$= 10$$

IIT
Ropar

All solutions to $x_1 + x_2 + x_3 = 7$ where
 x_3 is at least 4.

$$x_1 + x_2 + x_3 = 3$$

we move ahead to see what is $N(C_1, C_2)$, what does (C_1, C_2) mean? X_1 should be at least 3, X_2 should be at least 5, now the moment I insert X_1 to be at least 3 and X_2 to be at least 5 the sum becomes 8, boom,

(Refer Slide Time: 05:01)

$N(C_1, C_2)$

All solutions to $x_1 + x_2 + x_3 = 7$ where x_1 is at least 3 and x_2 is at least 5.

$3 + 5 + x_3 = 7$ X

IIT Ropar

NPTEL

we cannot go ahead because we must get $X_1 + X_2 + X_3$ to be 7 it is not going to happen here, and hence $N(C_1, C_2)$ is 0.

Now C_2, C_3 is X_2 should be at least 5, X_3 should be at least 4 even if you substitute X_2 as 5 and X_3 as 4, the sum is 9,

(Refer Slide Time: 05:26)

$$N(C_1, C_2) = 0$$

$$N(C_2, C_3) =$$

IIT
Ropar

All solutions to $x_1 + x_2 + x_3 = 7$ where x_2 is at least 5 and x_3 is at least 4.

$$x_1 + 5 + x_3 = 7$$

you cannot proceed ahead and hence $N(C_2, C_3)$ is 0, what happens with $N(C_1, C_3)$? $N(C_1, C_3)$ is those solutions where X_1 is at least 3, and X_3 is at least 4, if I substitute X_1 to be 3 and X_3 to be 4 it is satisfying the condition because I can substitute X_2 to be 0 and hence the sum is 7, (Refer Slide Time: 05:56)

$$N(C_1, C_2) = 0$$

$$N(C_2, C_3) = 0$$

$$N(C_1, C_3) =$$

IIT
Ropar

All solutions to $x_1 + x_2 + x_3 = 7$ where x_1 is at least 3 and x_3 is at least 4.

$$3 + 0 + 4 = 7$$

well this is the only possibility here, why? If I swap X_1 to be 4 it is possible but X_3 cannot be 3 because it must be at least 4, and hence no other solution is possible, the only possibility is 304, X_1 3, X_2 0, and X_3 4, and hence $N(C_1, C_3)$ is 1.

Now what about $N(C_1, C_2, C_3)$? If all three conditions must satisfy that X_1 must be at least 3, X_2 must be at least 5, and X_3 must be at least 4, then the sum is going to be at least $3 + 5 + 4$ which is 12, which is an invalid solution, and hence $N(C_1, C_2, C_3)$ is 0.

(Refer Slide Time: 06:47)

The slide content is as follows:

$N(C_1, C_2) = 0$
 $N(C_2, C_3) = 0$
 $N(C_1, C_3) = 1$
 $N(C_1, C_2, C_3) = 0$

All solutions to $x_1 + x_2 + x_3 = 7$ where x_1 is at least 3, x_2 is at least 5 and x_3 is at least 4.

$x_1 + x_2 + x_3 = 7$
 $3 + 5 + 4 \neq 7$

Now the question is how many solutions exist for this equation with these conditions, right, so what do we have to calculate $N(\bar{C}_1, \bar{C}_2, \text{ and } \bar{C}_3)$? $N(\bar{C}_1, \bar{C}_2, \text{ and } \bar{C}_3)$ here is equal to S naught - $S_1 + S_2 - S_3$ which is nothing but 36 which is S naught, S_1 is $15 + 6 + 10$ which is 31, so $36 - 31 + S_1$ which is $N(C_1, C_2) + (C_2, C_3) + N(C_1, C_3)$ which is 1, so $36 - 31 + 1$, and last one is $-S_3$ which is 0 here, so we need not worry about that, so the final answer is going to be $36 - 31 + 1$ which is 6,

(Refer Slide Time: 07:52)

$$\begin{aligned}N(\bar{c}_1, \bar{c}_2, \bar{c}_3) &= S_0 - S_1 + S_2 - S_3 \\ &= 36 - [15 + 6 + 10] + [0 + 0 + 1] \\ &\quad - 0 \\ &= 36 - 31 + 1 \\ &= 6\end{aligned}$$

so the number of integer solutions to the equation $X_1 + X_2 + X_3 = 7$ satisfying these conditions is 6.

(Refer Slide Time: 08:03)

Find the number of integer solutions to the equation $x_1 + x_2 + x_3 = 7$; $0 \leq x_1 \leq 2$, $0 \leq x_2 \leq 4$, $0 \leq x_3 \leq 3$

Answer: 6
